

REAL-ASSET INFRASTRUCTURE · OFFSHORE ENERGY

Own the hull the whole ocean has to rent. Contracted cash from day one.

The MPSS is a validated, class-approved deepwater production host — normally the single most expensive, longest-lead item in a field, built bespoke for \$600M+. The standardized MPSS builds for ~\$45M and leases on multi-year day-rate charters. You own a tangible, redeployable steel asset with a ~40-year life that pays cash on delivery — not a venture bet on a single well.

CASH PAYBACK ·
DISCOUNTED CHARTER

~60%

UNLEVERED NET CASH YIELD

~5x

CAPITAL BACK OVER FIRST 8-YR CHARTER

WHY THIS FITS A FAMILY OFFICE

- **A hard asset, not a paper bet.** Steel you can inspect, insure, mortgage, and redeploy — capital preservation with an inflation-linked, contracted income stream.
- **Cash from day one.** No J-curve. A signed charter pays a day rate the moment the hull delivers — distributions begin early, not after a decade.
- **Patient capital is the edge.** Your horizon matches a 40-year hull. PE funds must sell in five; you re-charter the same asset for decades.
- **Direct ownership, no blind pool.** One asset, one charter, one clear story — co-invest or own outright, sponsor capital alongside.
- **Downside is engineered, not hoped for.** Contracted revenue on top, hard collateral underneath, redeployment value at the end.

WHY NOW — AND WHY IT'S DE-RISKED

Deepwater is where the barrels are, but operators are forced to build a bespoke host and wait years for first oil. The MPSS removes that — already engineered, tested and classed.

- **Standard topsides, not marine-rated.** Its near-motionless hull runs ordinary land-type process gear — no costly "marineization" — so hull and topsides both cost a fraction of a bespoke build.
- **Standard shipyard steel** — a host for ~\$45M and ~14 months, not \$600M+ and years.
- **Approved by Lloyd's Register, ABS & DNV;** tank-tested to a 37.5 m survival wave, peer-reviewed and academically endorsed.

THE ECONOMICS — BASE CASE

All-in build cost (CAPEX)	\$45M
Charter day rate · discounted	\$150k / day
Utilisation (contracted)	92%
Gross revenue / yr	\$50.4M
Operating cost / yr	(\$23.5M)
Net operating cash / yr	\$26.9M
Net over 8-yr charter	\$215M

The cost advantage is the return. Incumbents build a deepwater host bespoke for \$600M+ over years; the standardized MPSS builds for ~\$45M. That lets us undercut every competing charter and still earn ~60% cash yield — the first 8-year charter returns roughly **5x your capital**, and one host's cash flow funds the next two. At the full incumbent day rate, payback falls **under six months**.

MOST-LIKELY MARITIME MARKET

Deepwater oil & gas production hosting. The proven, bankable beachhead — long charters to creditworthy operators, a multi-billion-dollar leased-FPU market today (Modec, SBM, Bumi Armada). The **same hull** then re-charters into drilling support, offshore-wind install, power, CCS, hydrogen and data centers — one asset, many revenue lives.

THE ASK

Anchor equity for the first standardized MPSS host — direct co-investment or outright ownership — against a signed or advanced-stage charter, then compound as each host's cash flow funds the next. Target profile: sub-2-year payback, ~60% unlevered cash yield, hard-asset downside and multi-decade redeployment upside.

Illustrative summary for discussion only — not an offer, solicitation, or guarantee of returns. Figures are modelled from a ~\$45M all-in build cost, a discounted \$150k/day production-host charter (vs \$350k+/day incumbent rates) and 92% utilisation (net = revenue – opex; payback = CAPEX ÷ net/yr), shown before financing, tax and mobilisation; full-rate, re-charter and multiple figures are indicative and depend on terms. Actual results vary with charter, counterparty, financing and market conditions. © Seaways MPSS.
