

REAL-ASSET INFRASTRUCTURE · OFFSHORE ENERGY

Own the hull the whole ocean has to rent. Contracted cash from day one.

The MPSS is a validated, class-approved deepwater production host — the single most expensive, longest-lead item in any offshore field. We build it **once**, to a standard design, and lease it on multi-year day-rate charters. You own a tangible, redeployable steel asset with a ~40-year life that starts paying cash on delivery, not a venture bet on a single well.

WHY THIS FITS A FAMILY OFFICE

- **A hard asset, not a paper bet.** Steel you can inspect, insure, mortgage, and redeploy — capital preservation with an inflation-linked, contracted income stream.
- **Cash from day one.** No J-curve. A signed charter pays a day rate the moment the hull delivers, so distributions begin early — no waiting a decade for an exit.
- **Patient capital is the edge.** Your long horizon matches a 40-year hull. PE funds must sell in five; you keep re-chartering the same asset for decades.
- **Direct ownership, no blind pool.** One asset, one charter, one clear story — co-invest or own outright, with sponsor capital alongside yours.
- **Downside is engineered, not hoped for.** Contracted revenue on top, hard collateral underneath, redeployment value at the end.

WHY NOW — AND WHY IT'S DE-RISKED

Deepwater is where the barrels are, but every operator is forced to build a bespoke host and wait years for first oil. We remove that bottleneck with a host that is already engineered, tested and classed.

- Approved by **Lloyd's Register, ABS & DNV** — primary structure, stability, mooring & ballast.
- Four decades of R&D, tank-tested to a **37.5 m survival wave**; peer-reviewed and academically endorsed.
- Standard shipyard steel, ~14-month hull delivery — **predictable cost, predictable schedule.**

THE ASK

Anchor equity for the first standardized MPSS host against a signed or advanced-stage charter — as a direct co-investment or outright ownership. Target profile: mid-teens unlevered cash yield, high-teens-to-low-20s levered, with hard-asset downside and multi-decade redeployment upside.

Illustrative summary for discussion only — not an offer, solicitation, or guarantee of returns. Figures are modelled from the reference host at \$600M CAPEX, a \$350k/day production-host charter and 92% utilisation (net = revenue – opex; payback = CAPEX ÷ net/yr), shown before financing, tax and mobilisation; levered and re-charter figures are indicative and depend on terms. Actual results vary with charter, counterparty, financing and market conditions. © Seaways MPSS.

THE ECONOMICS — BASE CASE

Build / lease-in cost (CAPEX)	\$600M
Charter day rate	\$350k / day
Utilisation (contracted)	92%
Gross revenue / yr	\$117.5M
Operating cost / yr	(\$23.5M)
Net operating cash / yr	\$94.0M
Net over 8-yr charter	\$752M

The first charter alone returns ~1.25× your capital in operating margin — and you still own a redeployable hull with decades of life. Every re-charter after that is margin against a depreciated asset, where multiples compound toward **2.5×+**. With conservative gearing on a contracted charter, levered equity cash-on-cash moves into the **low-20s%**.

MOST-LIKELY MARITIME MARKET

Deepwater oil & gas production hosting. The proven, bankable beachhead — long charters to creditworthy operators, a multi-billion-dollar leased-FPU market today (Modec, SBM, Bumi Armada). The **same hull** then re-charters into drilling support, offshore-wind install, power, CCS, hydrogen and data centers — one asset, many revenue lives.
